## **Abstract**

This paper presents a novel framework for understanding language as a transactional system rather than a static representational model. Drawing on insights from philosophy of language, communication theory, and social exchange theory, we develop a comprehensive approach that reconceptualizes linguistic interaction as a dynamic process of value creation and exchange. The framework demonstrates how language serves as the prototype for all forms of transaction, exhibiting universal accessibility, rule-governed structure, and context sensitivity. Through detailed analysis and case studies, we show how this transactional perspective offers deeper insights into both theoretical understanding and practical applications of language use. This work contributes to ongoing discussions in linguistic theory while opening new avenues for research in communication studies and related fields.

## **1 Introduction**

[Content from Introduction section]

## **2 Defining Transactions in Philosophical Context**

[Content from Section II]

### **3 Language as Prototype of Transaction**

[Content from Section III]

### **4 The Shift from Representation to Exchange**

[Content from Section IV]

### **5 Key Concepts in Transactional Interpretation**

[Content from Section V]

### **6 Conclusion**

[Content from Section VI]
